Abstract: As our country pays more and more attention to rural development, on this basis it begins to implement the rural revitalization strategy, and to provide corresponding policy support, the rural areas will develop in a better direction under this background. The coordinated development of rural regional economy under rural revitalization is an important method that can truly improve the level of rural economy, and it is also an important means to improve the happiness index of farmers' lives. This article first understands the requirements for the coordinated development of rural regional economy in the context of rural revitalization, then explains the current status of rural regional economic development in my country, and finally proposes corresponding solutions to the existing problems.

Keywords: Rural Revitalization; Rural Regional Economy; Coordinated Development; Research.

1. Introduction

To a certain extent, rural revitalization is our country's cognition of rural economic development, and it also shows that our country is beginning to attach importance to rural economic development, and on this basis, it proposes corresponding solutions. In order to truly achieve the goals that need to be achieved and improve the economic level of the countryside, it is necessary to formulate corresponding solutions based on the current rural conditions to promote the development of the countryside.

2. Requirements for the coordinated development of rural regional economy under the background of rural revitalization The rural revitalization strategy is another term for the construction of a new countryside.

It is also an important part of the current state work. It takes the adjustment of the

rural industrial structure as an important means, pays more attention to the construction of the ecological environment, and achieves the real realization through the harmonious coexistence of man and nature. To lay the foundation for a well-off society for all people, and realize the inheritance of traditional culture in this process. For the current rural development, it is mainly to promote the development of agriculture and make it truly modernized. With the gradual improvement of the rural environment, rural farmers' entrepreneurship has become a new trend and an important way to improve the level of rural economy.

Under such circumstances, the current rural areas mainly consider how to provide corresponding employment opportunities, increase farmers' income, and so on. my country's relevant conferences clearly pointed out that if we want to truly realize the industrialization of modern agriculture, we should provide certain help and support from policies and funds, and strive to help rural areas achieve healthy development. Only by ensuring that the countryside can cater to the development of modern society can we better achieve the goals of rural development and allow the regional economy to develop in a better coordinated manner. To truly realize rural modernization, the main method is to realize agricultural modernization and promote rural development through agriculture.

3. Current status of rural regional economic development

3.1 The performance of uneven economic development in rural areas

3.1.1 Unbalanced development among regions

My country has a vast territory, and the actual situation in the countryside will have a lot to do with the surrounding environment. To a certain extent, the natural resources possessed by different regions directly determine the level of rural development. In addition, my country has different levels of support for rural areas in different regions, which will definitely directly affect the development of various regions. In contrast, the rural areas in coastal areas should have better development advantages, have more natural resources, and have better development space. Therefore, it can be seen from the above that my country's rural regional economic development is not balanced, and there are still large gaps between regions.

3.1.2 Regional industrialization development varies

At present, the industrial development in western my country is relatively backward. This is because of the influence of natural resources and human resources, it is impossible to effectively carry out urbanization in this area, which makes urbanization construction relatively slow. The high level of industrialization in the eastern region can be seen from the economic income of farmers and the consumption capacity of farmers, which is much higher than that in the western region.

3.1.3 Imbalance of development model

Because there are many rural areas in our country, and the rural areas are divided into different levels, the economic development models of different rural areas are also different. Most of our country's rural areas are based on the traditional development model, that is, agriculture is the main content, which is greatly affected by environmental and human factors, which hinder rural development. In the eastern region, rural areas and cities have gradually begun to be combined, and cities are used to promote rural development, so that rural agriculture can be modernized and automated. This provides corresponding assistance for rural economic development and can also increase farmers' economic income. In this way, it can be seen that different development models have different impacts on rural areas, directly affecting rural economic income, making the gap in rural economic development increasing, and further affecting the coordinated development of regional economies.

3.2 Factors affecting the coordinated development of rural regional economies

3.2.1 Low level of agricultural modernization

At present, my country's rural development is mainly carried out around agriculture, and agriculture is gradually developing towards the level of automation and mechanization. However, due to the influence of my country's traditional agricultural economy, large-scale production cannot be effectively realized at present, and there are great differences between agricultural regional development. The main reason is that the value of agricultural production in my country is low, and most of the rural areas are still self-employed, which not only cannot effectively enhance the agricultural economy, but also cannot give full play to the value of crops. In the new era, rural areas have begun to change traditional agricultural product sales methods and use the Internet to sell agricultural products. However, some farmers are unable to sell agricultural products in time because of their backward thinking. This hinders the development of agricultural industrialization and further accelerates the incoordination of rural regional economic development.

3.2.2 Lower rural economic level

The main source of income for rural farmers is the sale of agricultural products. In recent years, due to the influence of the market, farmers' sales of agricultural products have also been affected. The income level of farmers is not high, and a large number of rural laborers flow to cities, making rural land idle or extensive. Under the long-term influence, it will directly hinder the economic development of rural areas, which is even more unfavorable to the economic development of rural areas, and affects the construction of the entire rural ecosystem.

4. Corresponding countermeasures for the coordinated development of rural regional economy under the background of rural revitalization.

4.1 Focus on the development of agricultural industrialization

In the context of rural revitalization, higher requirements are put forward for the development of rural industrialization, and the development of rural industrialization should be the core goal in this, and this method will be used to promote the stable improvement of the rural economy [5]. Therefore, we should take the development of agricultural industrialization as the core, rebuild the agricultural structure in line with the actual development of rural areas, and realize the coordinated development of agricultural regions. In this context, the relevant governments of various regions should encourage enterprises to actively participate in it, use various agricultural production and management methods to promote rural development, so that rural agriculture can truly achieve large-scale operations, change the traditional self-employed mode, and then Obtain more economic benefits. On this basis, enterprises are an indispensable means. They need to be used to effectively promote the development of rural agriculture and build an industrial chain of production, processing, and sales. This will not only reduce production costs more effectively, but also effectively increase Economic benefits to promote the coordinated development of various rural areas.

4.2 Vigorously promote agricultural modernization

To effectively improve rural living standards, we should pay attention to agricultural modernization. Under the new situation, agriculture must still be the foundation of rural development. If you want to implement the strategy of rural revitalization, you must develop agriculture and improve the level of mechanization and automation of agriculture to achieve coordinated development of the rural economy. All regions should make full use of their own environmental advantages to improve agricultural production efficiency, while other regions can learn from excellent rural development methods and make effective innovations in light of their actual conditions. The government also needs to provide corresponding policy support on this basis, give full play to the advantages of agricultural resources, improve the level of automation of agriculture, increase crop production, and build a new agricultural structure that meets current actual requirements.

4.3 Establish a flow mechanism for production factors

In view of the current problem of poor circulation of rural production factors in my country, corresponding solutions should be adopted to effectively improve production efficiency, establish a more complete agricultural production system, and effectively optimize its talents and technologies. Relevant departments of our country should improve the relevant systems of agricultural production in time, strengthen the

management of rural land, and better cultivate high-quality talents, so that they can meet the needs of mobile talents in the production factor market and provide them with more complete guarantees.

5. Conclusion

All in all, in the context of rural revitalization, the coordinated development of the rural regional economy is an important content of the research. If you want to truly solve this problem, the country should start from the overall perspective, give full play to the role of the government and various departments, and adjust the rural areas. The industrial structure of agriculture promotes the accelerated flow of rural production factors, provides it with corresponding talents that meet actual needs, and helps rural regional economies to quickly achieve coordinated development.
